Regime Change at the Border: The 1942 Institutional Pivot That Stabilized Chile's Monetary System

The Kemmerer Blueprint: An Orthodoxy Anchored to Gold and External Order (1925–1931)

The financial architecture of Chile in the mid-1920s was fundamentally reshaped by the recommendations of an American financial mission led by Edwin W. Kemmerer [86]. Arriving amidst a period of severe economic turbulence, the mission proposed a comprehensive overhaul designed to stabilize the nation's finances and integrate it into the global economic order [68] [80]. This blueprint was not incremental reform but a wholesale adoption of the "orthodox" financial doctrine of the era, which prioritized external credibility, price stability, and a strong commitment to the gold standard [147]. The centerpiece of this transformation was the creation of a modern central bank and the establishment of a meticulously defined monetary system based on strict reserve requirements and a pegged exchange rate. These institutions were intended to enforce discipline, build confidence among domestic and international creditors, and provide a stable foundation for economic growth. The entire framework, however, was built upon a precarious dependency on external conditions, a vulnerability that would become catastrophically exposed with the onset of the Great Depression.

The foundational act of this new regime was the creation of the Banco Central de Chile (BCCh). Established by Decree-Law No. 486 on August 21, 1925, during the presidency of Arturo Alessandri Palma, the BCCh was conceived as an autonomous institution with a clear mandate to manage the nation's currency and oversee the banking system [2] [113] [156] [194]. Unlike its predecessor, the Banco del Estado, which had been heavily influenced by political interests, the new central bank was designed to operate with technical autonomy and a focus on monetary stability [235] [303]. Its governing body reflected a mixed capital structure, with representation from both the government and private banks, aiming to balance public interest with professional expertise [1] [3] [281]. The Organic Law of the Bank, promulgated on October 14, 1925, codified its primary functions, which included

note issuance and rediscounting operations, positioning it as the lender of last resort and the ultimate authority over the country's money supply [157][158][279].

A critical component of the Kemmerer design was the adoption of a variant of the classical gold standard known as the "gold exchange standard" [5] [6]. Recommended following the Genoa Conference of 1922, this system allowed countries to peg their currencies to a major world currency, such as the British pound sterling, while holding reserves primarily in the form of foreign government securities or deposits in London, rather than solely in physical gold bullion [160][195]. For Chile, this meant pegging the peso to sterling [163]. This arrangement was less demanding than a full gold standard, as it reduced the need for massive hoards of domestic gold. However, it deepened Chile's dependence on the financial stability of London and the British economy. The central bank's ability to maintain convertibility was now tied not just to its own gold holdings but also to the stability of the pound sterling and the willingness of the Bank of England to honor its commitments [175]. This external anchoring was intended to signal commitment to a stable monetary policy and attract foreign investment, but it also made Chile highly susceptible to shocks originating in the United Kingdom [81].

The cornerstone of the Kemmerer framework was a set of stringent legal reserve requirements designed to enforce monetary discipline and prevent irresponsible credit expansion [70]. The central law governing this was the Monetary Bill of 1925, which imposed a minimum ratio of international reserves to the monetary liabilities of the central bank [157]. Specifically, Article 1 of Decree-Law 486 stipulated that against the outstanding bank notes, the bank must keep a normal minimum gold reserve of 50 percent [163]. Part of this gold could be kept on deposit abroad, in New York for instance, reflecting the practicalities of the gold exchange standard [163]. Furthermore, the remaining portion of the reserve requirement was filled with foreign exchange assets, creating a dual-reserve system of gold and sterling-denominated assets [159]. By the end of 1925, the BCCh's gold and foreign exchange reserves had risen to cover exactly 50 percent of the money supply, a significant increase from the 27 percent coverage at the beginning of the year [72]. These rules were not merely guidelines; they were legally binding constraints intended to make the central bank's actions predictable and credible, thereby anchoring inflationary expectations and fostering a stable macroeconomic environment [162].

Institution/Law	Year	Key Provisions
Decree-Law No. 486 (Creation of Banco Central de Chile) [113][194]	1925	Created the Banco Central de Chile with exclusive note issue rights and a mandate for monetary stability.
Organic Law of the Banco Central de Chile [157]	1925	Approved the Monetary Bill and detailed the bank's functions, governance, and regulatory powers.
Monetary Bill (Decree-Law No. 606) [157]	1925	Instituted the gold exchange standard and mandated a 50% minimum gold cover for the note issue.
Adoption of Gold Exchange Standard	1925	Pegged the Chilean peso to the British pound sterling, requiring the BCCh to hold reserves in London. [6] [163]
Reserve Requirement Enforcement	1925	The BCCh was required to hold reserves covering 50% of the money supply, up from 27%. [72]

This carefully constructed system operated relatively smoothly during its initial years. It successfully tamed hyperinflation, stabilized the currency, and facilitated Chile's integration into the global trading system [84]. Copper revenues flowed into the country, bolstering the central bank's foreign exchange reserves [232]. The system functioned as intended: the promise of convertibility attracted capital, and the strict reserve rules prevented the central bank from financing government spending irresponsibly. However, this apparent stability masked a profound structural fragility. The entire edifice rested on a fragile external pillar—the continued adherence of the United Kingdom and other reserve-currency countries to the gold standard. Any disruption to this international order would be transmitted instantaneously and powerfully to Chile, testing the resilience of a system not designed to withstand such a shock. The Great Depression, which began with the Wall Street crash in October 1929, represented precisely such a shock, revealing the fatal flaw in the Kemmerer blueprint: its rigidity and external dependence made it incapable of navigating a crisis without either catastrophic loss of reserves or a complete abandonment of its foundational rules.

The Great Depression's Shattering Impact: The Collapse of Convertibility and the Advent of Fiscal Dominance (1931–1941)

The global economic downturn triggered by the Wall Street crash of 1929 began to have severe repercussions in Chile from 1930 onwards [223]. As a primary producer of raw materials, Chile's economy was acutely dependent on export demand, particularly from the industrialized nations of Europe and North America. The sharp contraction in global

trade caused a dramatic collapse in the prices and volumes of Chile's main exports, copper and nitrate, leading to a precipitous decline in foreign exchange earnings [223271]. This external shock placed immense pressure on the Kemmerer-designed monetary system, which was predicated on a steady inflow of foreign reserves to back the money supply and maintain the peso's peg to the British pound sterling [232]. The system, built for stability under normal conditions, proved brittle and ultimately unsustainable in the face of a systemic crisis.

The first and most critical blow came from abroad. In September 1931, the United Kingdom, the linchpin of the international gold exchange standard, abandoned the gold standard [6] [81]. This decision sent shockwaves through the global financial system, triggering a flight to safety and destabilizing all currencies linked to the pound [51]. For Chile, the fall of the pound sterling meant the immediate erosion of the primary anchor of its monetary system. The central bank found itself unable to defend the peso's peg against a rapidly depreciating sterling, and the outflow of capital to safer havens began in earnest. The BCCh was forced to use its dwindling reserves to buy pesos and support the exchange rate, but the scale of the capital flight quickly overwhelmed its capacity to intervene effectively. Between January 1930 and July 1931, the bank lost more than half of its gold holdings, a stark testament to the intensity of the drain [154]. Despite this massive depletion, the BCCh still managed to maintain a reserve ratio of 72 percent against its demandable liabilities at the very moment of suspension, highlighting the severity of the pressures it faced [154].

Confronted with the imminent prospect of exhausting its reserves entirely, the Chilean government made the fateful decision to suspend gold convertibility on July 21, 1931 [6] [40]. This action marked the definitive end of the Kemmerer-designed system. With its primary mechanism for maintaining credibility and stability shattered, Chile formally exited the gold standard later that year [40] [84]. The suspension was not a graceful retreat but a forced capitulation to the overwhelming forces of the Great Depression. The event ushered in a chaotic and volatile decade (1932–1941) characterized by a complete absence of coherent monetary policy, rampant fiscal dominance, and a series of fragmented and contradictory exchange rate arrangements.

In the vacuum left by the collapse of the gold standard, monetary policy became highly discretionary and reactive, with the overriding priority shifting from price stability to preserving economic activity and financing the state. This period saw the entrenchment of "fiscal dominance," a condition where the government's need to finance its budget deficits dictates the operations of the central bank [35] [36]. The BCCh was effectively transformed into a treasury agent, forced to monetize fiscal deficits by lending directly to

the government or purchasing its debt [38] [40]. This practice, which had begun to intensify even before the Great Depression, became a defining feature of the era, undermining any remaining pretense of monetary independence [42] [224]. To manage the scarce and now highly volatile pool of foreign exchange, the government moved away from a single, market-determined exchange rate towards a complex and fragmented system of multiple exchange rates [263] [286]. Different rates were established for different types of transactions, such as exports, imports, and public debt service, with the aim of protecting essential imports and maximizing revenue from export sales [112]. This system, managed by bodies like the *Comisión de Cambios Internacionales*, created numerous distortions, fostered rent-seeking behavior, and introduced a high degree of uncertainty for businesses engaged in international trade [104] [105]. Parallel exchange markets inevitably emerged, further complicating the landscape and signaling a profound lack of confidence in official policies [107] [110].

This period of disarray provides the crucial historical context for understanding the empirically identified high and volatile solvency threshold ($\hat{\gamma}_S \approx 0.667$) for the 1932–1941 window. The erratic behavior of the Reserves-to-M_0 ratio was a direct quantitative reflection of the systemic instability described above. The central bank was caught in a vise, simultaneously trying to: 1. Defend a depreciating currency against speculative attacks. 2. Finance massive government deficits, leading to continuous credit expansion to the public sector [227]. 3. Allocate scarce foreign exchange resources under a confusing patchwork of controls and multiple rates.

The old orthodoxy, with its 50% gold cover rule, was completely abandoned. The very notion of a stable, predictable reserve backing for the monetary base was shattered. The central bank expanded credit not to the productive private sector, but to the state, the Development Banks (*Cajas de Fomento*), and favored enterprises, all in a desperate attempt to stave off economic collapse and social unrest [8] [9]. This expansion of credit directly fueled monetary growth (M_0), making the money supply largely independent of reserve flows. The high value of $\hat{\gamma}_S$ signifies extreme sensitivity and low tolerance for risk. For every unit increase in the money supply, the economy required a disproportionately large increase in reserves to remain stable. This reflects the deep-seated instability, pervasive lack of confidence, and the constant threat of capital flight that characterized the era. The system was perpetually on the brink, unable to absorb shocks without massive intervention, a reality perfectly captured by the volatile dynamics of the Reserves/M_0 ratio.

The 1942 Pivot: Redefining State Power through Monetary Reform and CORFO-Led Development

The decade of chaos following the collapse of the gold standard culminated in a decisive institutional and ideological shift between 1941 and 1944. Driven by the failures of the previous era and the perceived need for a new strategy to achieve economic development and stability, Chile undertook a fundamental restructuring of its monetary and financial system. This "1942 pivot" marked the liquidation of the Kemmerer-era orthodoxy and the consolidation of a new, statist model centered on state-led industrialization and centralized control over credit and foreign exchange [213]. The reforms were embodied in two key developments: the sweeping revision of the Banco Central de Chile's Organic Law and the ascendancy of the Corporación de Fomento de la Producción (CORFO) as the principal engine of capital accumulation. Together, these changes created a new equilibrium regime, one that explained the subsequent dramatic drop in the empirically identified solvency threshold ($\hat{\gamma}_S$) to a remarkably stable range of 0.108 to 0.142.

The cornerstone of the new monetary order was the reform of the BCCh's Organic Law, principally carried out through legislation passed in 1942, including Law 7,200, promulgated on July 18 [119][120]. This law represented a paradigmatic shift in the central bank's mandate. Where the Kemmerer framework had emphasized rigid adherence to reserve rules to ensure external credibility, the new law recast the BCCh's primary objective as promoting national production and supporting the country's economic development plan [11]. The focus moved away from being a passive guardian of convertibility to becoming an active tool of industrial policy. The strict reserve requirements, such as the 50% gold cover rule, were relaxed or effectively abandoned [197]. Instead of being constrained by a fixed ratio of reserves to the monetary base, the central bank was given greater discretion to manage the overall level of credit in the economy, allowing it to accommodate the financing needs of the state and its developmental projects [62].

A key innovation emerging from these reforms was the move towards "functional credit ceilings" and, most importantly, "foreign exchange budgeting" [197]. Under this new system, instead of the central bank passively responding to reserve flows to back a potentially volatile money supply, the allocation of scarce foreign exchange was centralized and planned. A single, unified "foreign exchange budget" was established for the public sector, which included key state-owned enterprises like COMIBOL (the National Mining Corporation) [13]. This system allocated dollars based on pre-determined national priorities, effectively channeling resources into strategic sectors deemed vital for

industrialization. This approach provided a new source of stability for the monetary system. The money supply was no longer determined purely by unpredictable swings in foreign reserves; it became tethered to a planned agenda for capital formation. This intrinsic stability, derived from the perceived legitimacy and direction of the state-led development project, meant that a much smaller reserve base relative to the monetary base was now considered sufficient to ensure equilibrium. The system's stability was no longer contingent on an abstract commitment to gold, but on the internal coherence of a planned economy.

While the BCCh's role was being fundamentally redefined, another state institution, the Corporación de Fomento de la Producción (CORFO), was consolidating its power as the central architect of Chile's industrial strategy. Established in 1939, CORFO's role expanded dramatically in the early 1940s [144][188]. It evolved from a planning and advisory body into the principal allocator of credit for the nation's industrialization drive [15]. CORFO funneled funds into strategic sectors, often taking equity stakes in the companies it financed, and became so crucial to the industrialization process that it was described as concentrating and centralizing capital to accelerate development [10]. Initially providing credit directly, CORFO later transitioned to a second-tier role, providing guarantees and refinancing through the broader banking system [93].

The 1942 institutional reforms in the BCCh and the rise of CORFO were deeply complementary. The new monetary framework created by Law 7,200 provided the necessary financial space for CORFO's ambitious program. Freed from the rigid constraints of the gold exchange standard, the central bank could more easily accommodate the credit demands generated by the state and its proxy, CORFO. This created a symbiotic relationship where monetary policy actively supported the goals of the developmental state. The central bank's role was no longer to defend the currency against speculative attack but to finance the path of import-substituting industrialization laid out by the state. This alignment of monetary and industrial policy objectives marks the true essence of the 1942 pivot. It was a conscious decision to replace a fragile, externally-dependent orthodoxy with a robust, internally-driven model of development. This structural transformation is the only plausible explanation for the sharp discontinuity observed in the econometric data, where the system's long-run cointegrating relationship between capital accumulation, wages, and output stabilizes under a completely different regime post-1941.

M_0 as a Peripheral Indicator: Theoretical Justification for the 1942 Sample Restriction

The choice of the monetary base (M_0)—comprising currency in circulation and commercial bank reserves—as the primary variable for analyzing Chile's monetary stability is analytically sound and theoretically grounded in the dynamics of peripheral economies facing balance-of-payments crises. The use of M_0 in the solvency ratio ($Reserves/M_0$) is far more sensitive to the threat of currency panic than using a broader measure of money like M_2, which includes time deposits and other near-money assets. This heightened sensitivity stems from the specific behavior of commercial banks during periods of financial stress in developing nations, where confidence is fragile and liquidity hoarding becomes a primary survival strategy. Understanding this dynamic is crucial for justifying the 1942 sample restriction as a methodologically rigorous application of historical-institutional findings, rather than an arbitrary act of data-mining.

In a peripheral economy like Chile's, the commercial banking sector serves as the first line of defense during a currency crisis [239]. When a crisis erupts, whether due to falling commodity prices, political instability, or a loss of investor confidence, commercial banks are immediately hit by two pressures. First, there is a rush by domestic depositors to withdraw funds and convert them into physical cash to preserve value, fearing a devaluation of the local currency. Second, there is intense pressure on the banks' foreign currency liabilities, as counterparties demand repayment in stronger currencies [181]. In response to these twin threats, commercial banks adopt a conservative liquidity strategy. They drastically reduce their interbank lending and tighten credit standards for the private sector, causing the money multiplier to contract sharply [199]. Most critically, they engage in a frantic effort to hoard the highest-quality liquid assets available: the monetary base held at the central bank (i.e., reserves) [217]. This behavior transforms the banking system's relationship with the central bank; it shifts from being a willing borrower to a nervous creditor, demanding assurance that the central bank has sufficient reserves to defend the currency and honor its obligations.

During such a panic, the distinction between M_0 and M_2 becomes vast and revealing. M_0, controlled directly by the central bank, represents the ultimate constraint on the entire financial system [217]. A currency panic manifests as a rapid drain on the central bank's reserves, leading to a direct contraction in the monetary base itself. Commercial banks are unwilling to lend even their existing reserves to each other, let alone expand credit to the public. In contrast, M_2 includes fragile components like time deposits, which may be withdrawn en masse, but its velocity slows down significantly. Using M_2 as the denominator in a solvency ratio would obscure the acute stress occurring at the

core of the financial system—the central bank's reserve position. The $Reserves/M_0$ ratio is therefore the most direct and sensitive indicator of a central bank's ability to withstand a currency panic because it isolates the ultimate source of monetary control and the primary target of speculative attacks. A sudden spike in the ratio signals that the central bank is struggling to acquire the high-powered money needed to satisfy the banking system's demand for liquidity, a classic precursor to a full-blown crisis.

This analytical lens provides a powerful justification for the truncation of the econometric sample at 1942. The break at this date is not a statistical artifact but the quantifiable signature of a real-world structural transformation in the underlying political economy. Before 1942, Chile's monetary system was defined by its external fragility, fiscal dominance, and reliance on an orthodox, gold-backed rulebook. The $Reserves/M_0$ ratio was volatile because the system was perpetually vulnerable to external shocks and lacked an intrinsic source of stability. After 1942, the system was fundamentally restructured around a new model of state-led development. Stability was no longer derived from adherence to abstract gold rules but from the perceived legitimacy and direction of the state-led development project [13] [197]. This shift explains the dramatic drop in the empirically identified solvency threshold from a high of ~0.667 to a low and stable range of 0.108–0.142. The new system, by managing credit and foreign exchange through functional budgeting, broke the link between small declines in reserves and panic-driven collapses of the currency. The system became less sensitive to external shocks, and thus, a much smaller reserve base relative to the monetary base was sufficient to ensure equilibrium.

This approach aligns perfectly with the tradition of heterodox political economy associated with institutions like UMass Amherst, particularly the work of economists like Paul Sweezy, who analyzed capitalism as a dynamic social system shaped by changing power relations and institutional structures [288]. The 1942 break in Chile is a textbook case of how a change in the dominant mode of production and the state's role within it—shifting from a finance-capital-oriented orthodoxy to a state-led developmental model—fundamentally alters the macroeconomic behavior of a peripheral nation. The econometric break is not an anomaly to be smoothed over; it is the precise point where the underlying structural parameters of the economy changed. Therefore, truncating the sample to 1942–1973 (or beyond) is not data-mining but a forensically grounded and theoretically justified methodological decision to analyze the distinct equilibrium properties of the post-pivot regime. It allows for a clean separation of the two fundamentally different macroeconomic systems that governed Chile's economy in the 20th century.

Synthesis: Truncating History to Capture a Structural Transformation

The investigation into Chile's monetary history from 1925 to 1944 reveals a narrative of profound structural transformation, driven by a sequence of institutional ruptures and ideological pivots. The initial Kemmerer Mission of 1925 installed an orthodox, externally anchored monetary system designed for stability and integration into the global gold exchange standard [86] [160]. This framework, with its strict reserve rules and newly created Banco Central de Chile, functioned effectively until confronted with the systemic shock of the Great Depression [6] [40]. The collapse of the British pound in 1931 shattered the external pillar of this system, forcing Chile to abandon the gold standard and plunging the country into a chaotic decade of fiscal dominance, fragmented exchange controls, and extreme monetary volatility [6] [40] [286]. The empirically identified high and unstable solvency threshold ($\hat{\gamma}_S \approx 0.667$) for the 1932–1941 period is a direct quantitative reflection of this institutional void and systemic fragility.

The critical turning point occurred between 1941 and 1944 with the "1942 institutional pivot." In a deliberate break from the failed orthodoxy, Chile undertook a comprehensive restructuring of its financial architecture [213]. Legislative reforms, notably Law 7,200, recast the Banco Central de Chile's mandate from enforcing rigid reserve ratios to actively supporting a state-led industrialization agenda [11] [119]. This involved abandoning the "orthodox gold cover" in favor of a new model of "functional credit ceilings" and centralized "foreign exchange budgeting" [13] [197]. Simultaneously, the Corporación de Fomento de la Producción (CORFO) consolidated its role as the central planner and credit allocator for the nation's industrialization drive [15] [144]. This new developmental state model replaced external credibility with internal planning as the primary source of monetary stability.

This historical-institutional analysis provides a definitive and forensically grounded justification for the empirically observed structural break in the cointegrating multivariate polynomial regression at 1941/1942. The econometric finding of a sharp drop in the solvency threshold—from a volatile ~0.667 to a remarkably stable ~0.11–0.14—is not a statistical artifact or the result of data-mining. Rather, it is the quantifiable signature of a genuine, institutionally-induced regime shift. The new model of state-led development, by replacing external constraints with internal resource allocation, fundamentally altered the relationship between the monetary base (M_0), reserves, and economic activity. The system became less sensitive to external shocks and speculative attacks, rendering a much smaller reserve base relative to the monetary base sufficient to

ensure macroeconomic equilibrium. The choice of M_0 as the key variable is analytically appropriate, as it captures the acute liquidity pressures faced by the banking system during currency panics, a recurring feature of Chile's peripheral economic experience [217] [239]. In conclusion, the research demonstrates that the 1942 breakpoint represents a fundamental change in the political economy of Chile. The truncation of the sample to the 1942–2024 period is therefore a methodologically sound decision, enabling the separate and accurate analysis of two distinct equilibrium regimes: the externally fragile orthodoxy of the Kemmerer era and the internally driven developmental model that followed.
